

## E.Print- Out Coding

A screenshot of a code editor window showing a Python script. The script is titled 'print(program faktor bilangan).py'. It contains a function 'print(program faktor bilangan)' that prints the program name, user name 'Eni Naura Sari Girsang', and user ID '1306625100'. It then enters a 'while True' loop where it asks for a number less than 100. If the input is 0, it breaks. Otherwise, it calculates the factors of the input number and prints them. The factors of 24 are listed as [18, 1, 2, 3, 4, 6, 8, 12, 24].

```
1 print('program faktor bilangan')
2 print(' nama:Eni Naura Sari Girsang')
3 print(' nim: 1306625100')
4 print('\n')
5
6 while True:
7     hasil = [18]
8     n = int(input('masukkan bilangan <100 (selesai)=0 '))
9     if n ==0:
10        break
11    for i in range (1, n+1):
12        if n % i == 0:
13            hasil.append(i)
14    print('faktor bilangan', n, 'adalah', hasil)
15    print('selesai')
```

## F.Print Screen Hasil Keluaran

A screenshot of a terminal window showing the output of the Python script. The terminal shows the command to run the script, followed by the program's output. The output includes the program name, user information, and a prompt for a number. The user enters 24, and the program outputs the factors of 24: [18, 1, 2, 3, 4, 6, 8, 12, 24].

```
PS C:\Users\NAURA\AppData\Local\Programs\Microsoft VS Code> & C:\Users\NAURA\AppData\Local\Programs\Python\Python314\python.exe "c:/Users/NAURA/pr
int('program faktor bilangan').py"
program faktor bilangan
nama:Eni Naura Sari Girsang
nim: 1306625100

masukkan bilangan <100 (selesai)=0 24
faktor bilangan 24 adalah [18, 1, 2, 3, 4, 6, 8, 12, 24]
selesai
masukkan bilangan <100 (selesai)=0
```
