

E. Print- Out Coding

The screenshot shows the Visual Studio Code editor with a file named 'LA-MODUL-1-1306625100-ENSG.py'. The code is a Python script for temperature conversion. It starts with a header print statement, followed by user input for 'nama', 'nim', 'suhu_awal', 'suhu_akhir', and 'selang'. It then prints a table header 'TABEL KONVENSI' and a table of conversion values for Celsius, Fahrenheit, and Reamur. The table is generated using a while loop and formatted string literals. The code ends with a 'selesai' print statement.

```
1 print("pemograman konvesi suhu")
2 print(" nama : Eni Naura Sari Girsang")
3 print(" nim :1306625100")
4 print()
5
6 x = int(input("suhu_awal :"))
7 y = int(input("suhu_akhir :"))
8 z = int(input("selang :"))
9 print()
10
11 print("TABEL KONVENSI")
12 print()
13 print('-' * 57)
14 print("| {0:^5}|{1:^15}|{2:^15}|{3:^15}|".format('no','celcius','Fahrenheit','Reamur'))
15 print('-' * 57)
16
17 n=1
18 while (x<= y):
19     c = round((4/5) * c)
20     R = round((9/5) * c + 32)
21     F = round((9/5) * c + 32)
22     print("| {0:^5}|{1:^15}|{2:^15}|{3:^15}|".format(n,c,R,F))
23     n=n+1
24     x=x+z
25
26 print('-' * 57)
27
28 print()
29 print("selesai")
```

F. Print Screen Hasil Keluaran

The screenshot shows the Visual Studio Code editor with the 'Terminal' tab active. The terminal displays the output of the Python program. It shows the user input for 'nama', 'nim', 'suhu_awal', 'suhu_akhir', and 'selang'. It then prints a table header 'TABEL KONVENSI' and a table of conversion values for Celsius, Fahrenheit, and Reamur. The table is generated using a while loop and formatted string literals. The code ends with a 'selesai' print statement.
